

On Page 17, Paragraph 3:

As described above, in the circuit structure of the pixel PXL shown in Fig. 5, when once the data voltage Vdata is written in the pixel PXL, the organic electroluminescent element OLED keeps emitting light at a fixed brightness during a frame interval until the written data voltage Vdata is next re-written. When many pixels PXL like this are arranged in a matrix form as shown in Fig. 6, an active matrix type display apparatus can be constituted. As shown in Fig. 6, the display apparatus is composed by arranging the scanning wirings X1 to XN for selecting the pixels PXL and the data wirings Y for supplying the brightness information, i.e. data voltages Vdata, for driving the pixels PXL arranged in a matrix form.

**IN THE CLAIMS:**

Please cancel claims 1-4 without prejudice or disclaimer.

**IN THE DRAWINGS:**

A Request for Approval of Drawing Corrections proposing red-line corrections to FIGS. 6, 7 and 8 is filed herewith.

**REMARKS**

Entry of the foregoing Preliminary Amendment prior to examination is respectfully requested. Claims 5-8 are pending in the application. This Preliminary Amendment cancels claims 1-4 without prejudice or disclaimer. This amendment is requested to put the divisional application in substantially the same condition as its parent Application No. 09/711,880.
